

What you are actually allowed to do.

Most people either avoid AI entirely or use whatever is on their phone. Both come from the same place. Nobody told you where the lines are.

THE SHIFT

The rules are not the thing standing between you and using this well. **Not knowing the rules is.** And that takes about five minutes to fix.

There is a list

Somebody reviewed where the data goes and put a short list of approved tools in front of you.

That list is not a restriction. Inside it, you are covered.

Approved is not the same as free

The approved version usually carries an agreement that your information is not used to train somebody else's model.

Same name on the box.
Completely different terms.

You own what you send

If AI drafts it and you forward it with your name on it, it is your work now.

The tool is an assistant. It is not a signature.

WHERE THE LINE SITS

Never goes in the box

Patient names and anything from a chart. Dates, room numbers, or details that could point to one patient. Employee records and discipline files. Anything you would hesitate to read out loud in a public meeting.

Most of your work is none of that

A memo about a schedule change. Comparing two quotes. Turning your notes into a clean procedure. Rewriting a message so it lands better. None of it touches protected information.

The standard to hold it to

Treat it exactly like a capable new employee. You would let them draft something. You would not let them send it up the chain without reading it first.

YOUR CHALLENGE THIS WEEK

Two questions, one email. Which AI tools are approved for staff use, and is there written guidance I should read?

People ask that every day and nobody gets in trouble for asking. If the answer is that a policy is still being written, you are not behind.

Before you send anything, read it. You are the pilot. AI is the co-pilot. Every decision still goes through you.

Next episode · **Go deep, not wide.** Why chasing the newest tool is usually the wrong move.
