

Build your workspace.

Every new chat starts from zero. A workspace is the fix, and almost nobody switches it on.

THE SHIFT

A workspace gives AI a permanent home for one kind of work, so you stop re-explaining yourself every time you sit down. But loading documents is not the same as using them. **You have to tell it to look.**

Job description

Who it is, how you want it to work, what to avoid. Written once, applies to everything.

Brain

What you load in. Policies, templates, standard forms, the reference material you always dig for.

Tools

What it is allowed to reach. Your files, the web, whatever your organization has turned on.

Tasks

Your conversations. Every chat inside already has the other three standing behind it.

THE PART ALMOST EVERYBODY MISSES

Write the line that wakes it up

Put it right in the job description. Always check the documents in this workspace before you answer. Do not fall back on general knowledge when the answer is in my files.

Then say it again when you sit down

Open a new chat with: before we start, review the materials in here, then help me with this.

The binder on the desk

Think of a sharp new employee. The binder is sitting right there. Sometimes you still have to say, check the binder first.

Where to find it. Workspaces go by different names. Gems in Gemini. Projects and Custom GPTs in ChatGPT. Agents and Notebooks in Copilot. Notebooks in NotebookLM. Check which ones your organization has turned on.

YOUR CHALLENGE THIS WEEK

Pick one job you do over and over from the same reference material. Build that workspace and write the line that tells it to check your documents.

Then test it. Watch whether the answer actually comes back out of what you loaded.

Before you send anything, read it. You are the pilot. AI is the co-pilot. Every decision still goes through you.

Next episode · **Make it sound like you.** Set your voice once and reuse it everywhere.
