

If you work at a desk.

Eleven tabs. A form filled out wrong. Two people at the front desk and the phone ringing. The thing you actually needed to finish is still in the corner of the screen.

THE SHIFT

When people talk about AI saving time at a desk they talk about typing faster. That is not your bottleneck. Your bottleneck is forty things that all look a little different. **The win is that you stop starting over.**

Write the instruction down once

Quotes come in. Rather than reading them side by side every time, decide once what you always need to know.

Total cost, what is included, what is missing, and what should I be asking.

Answer it once, keep the answer

The question you field forty times a week at the front desk.

Plain language, short, no jargon, and a second language if your patients need one.

Second set of eyes

Before the message goes to the whole department, hand it over first.

What is going to be misunderstood here, and what question will I get back?

TWO RULES FOR THE DESK

Records stay out

No names, no patient information, nothing from a chart, nothing that belongs in a personnel file. Describe the situation, not the person.

Check anything that is a number or a date

It will be confident either way. You are the one who knows whether that figure is right.

What you are actually buying

You are not trying to do Tuesday faster. You are trying to never build Tuesday from scratch again.

Where to find it. NotebookLM, a Copilot Notebook, or a ChatGPT Project. Check what your organization has turned on.

YOUR CHALLENGE THIS WEEK

Pick the one thing you do the same way every single week. Do it once with AI, and write down the instruction you used.

Save it somewhere you will find it. Next week, use it again.

Before you send anything, read it. You are the pilot. AI is the co-pilot. Every decision still goes through you.

Next episode · **Before it walks out the door.** Capturing what only one person knows how to do.
