

Before it walks out the door.

The person who knows how to get the old scanner talking to the system. The one who knows what to do at six in the morning when nobody is answering the phone.

THE SHIFT

Everybody says we really should document that, and it never happens. Not because anybody is lazy. The knowledge was never the hard part. **The writing was.** Take the writing away and all that is left is talking.

Record the conversation

Fifteen or twenty minutes. Ask them to walk it through the way they would tell a new hire.

Let them ramble. The tangents are where the real knowledge lives.

Hand it over

Give the transcript to AI with a clear role and a clear output.

Turn this into a numbered procedure in plain language that somebody new could follow.

Ask for the gaps

This is the line that makes the whole thing worth doing.

Flag anything the speaker assumed I would already know.

TWO THINGS THAT MAKE IT STICK

Their name goes on it

The draft goes back to the expert. They read it, fix what is wrong, and sign off. They did not lose anything by writing it down. They became the person who defined how this gets done here.

You can do this for yourself

No permission needed and no project required. There is something you do that nobody else does the same way.

Why the gap list matters

An expert skips steps. Not on purpose. After twenty years those steps are not steps anymore, they are breathing. AI does not know any of it, so it notices every one.

YOUR CHALLENGE THIS WEEK

Pick one thing. The one where, if you were out for two weeks, somebody would be calling you. Record yourself explaining it for fifteen minutes.

Then read the procedure that comes back.

Before you send anything, read it. You are the pilot. AI is the co-pilot. Every decision still goes through you.

Next episode · **When it gets it wrong.** How to catch it and how to fix the conversation.
